

Workshop

# Strategies and assets for the HMI design in semi and fully autonomous vehicle

Roberto Montanari

2017 - HUMANIST SUMMER SCHOOL Human Factor issues for the future car autonomous  
experience

Vigo, 13-14-15 September

RE:Lab

# Summary

- The HMI
- Some steps in the HMI evolution
- Design assets in fully and/or partly autonomous driving
- Design principles and their application to the autonomous vehicle perspective
- Design challenges
- Design tools
- Appendix: design thinking tool

# The HMI

# Human Machine Interface

# The scenario: primary and secondary commands

# The automation path from HMI perspective (1/2)

# The automation path from HMI perspective (2/2)

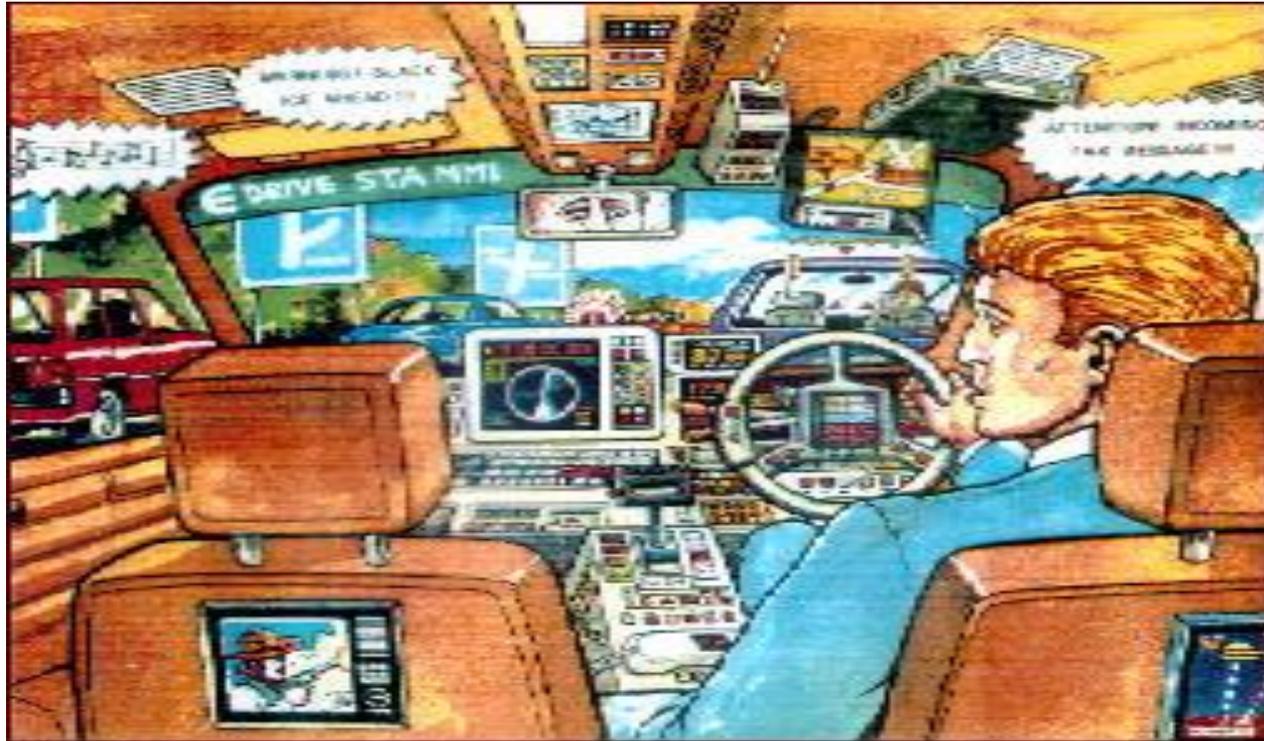

# Some steps in the HMI evolution

# First step... buttons per functions

# Second step... integration

Lancia Dialogos 1998

Lancia NEA 2001

# Third step – adaptiveness

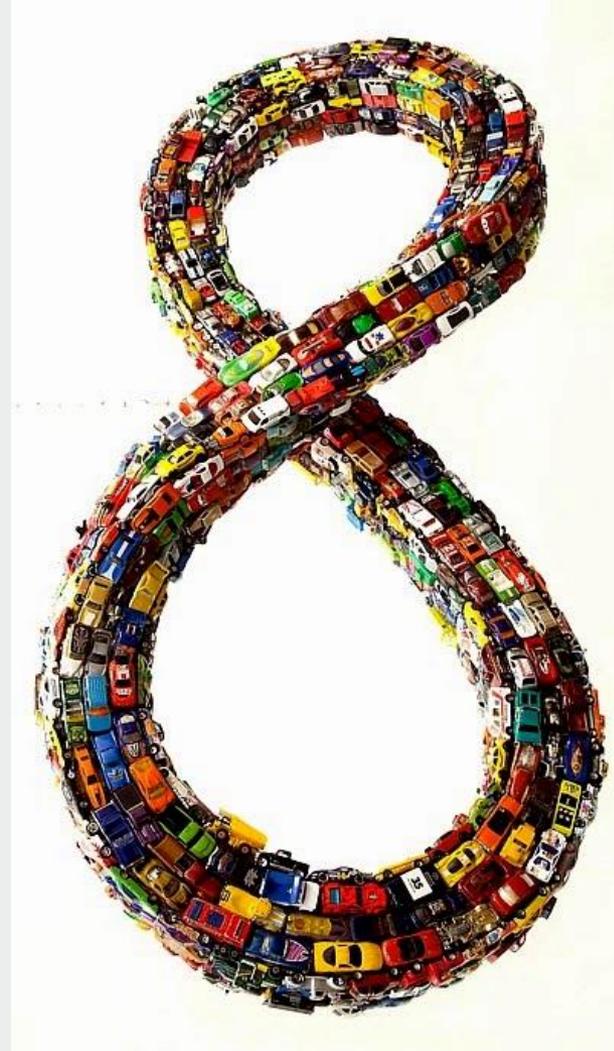

- In-vehicle Human Machine Interface (HMI), adaptive in real-time to the driving and driver conditions
- Integration into a working car of an HMI designed around users, iteratively assessed in virtual simulator and real roads

## Fourth steps

- Fully multimodality in the interaction, i.e. vocal, visual, haptic, gesture based and eye-tracked seamlessly

# Fifth one (CES 2017): new frontiers

connectivity

Car adaptiveness

# Ironies of Automation (Bainbridge, 1983)

**The more complex an automated system is,  
the more important the role of the human operator  
becomes.**

Automation takes over tasks that humans find annoying or are bad at.

- **But: Operator has to monitor if the systems is doing the right thing**

The more reliable the automated system, the lesser the human has to intervene and correct the automation.

- **But: The lesser the human has to intervene, the harder it will be**

# Take Over Request: Design solutions

# Transition design: Take Over Request

Explanation of the reason of take over (in order to make the driver aware of the system capabilities)

Countdown for take over

Urgent take over needed (the colour turns into red to highlight the urgency)

Forser, Y., et al., (2016), Your Turn or My Turn? Design of a Human-Machine Interface for Conditional Automation

# Transition design: Take Over Request

HMI with automation scale and automation monitor;

HMI with message field faded in.

Elements of basic TOR: On-Screen Warning + acoustic gong;

Extended TOR: Mobile phone integrated, brake jerk.

V. Melcher, S. Rauh, F. Diederichs, H. Widlroither, W. Bauer, (2015) Take-Over Requests for automated driving

- Feedback
- Conceptual mode

# Design guidelines for automated vehicles

Class	Guidelines	Reference
Human-automation interaction	Avoid as possible supervisory task in the interaction with highly automated vehicles	Endlsey (1995)
	Develop an efficient interaction for authority transition, considered as a trade-off between SA, driving comfort and workload level	Hancock (2013)
	Build a coherent mental model between human and automation	Lee (2004)
	Measure "Trust in automation" as key factor for an efficient driving performance	
Multimodal HMI	Combine in an accurate way the multimodality strategies (temporally cascaded, redundant, fused)	Muller (2010)
	Multimodal HMI can reduce temporal effort, but add cognitive one: evaluate the use of multimodality due to the need	Weinberg (2010)
	Combine different evaluation strategies to evaluate multimodality and adapt general usability guidelines for in-vehicle HMI	
	Use of "information mirroring" (e.g. on HUD or mobile device) can improve global performance	
	Ensure learnability and visibility of the interfaces	
Takeover request (TOR)	TOR can be mirrored on HUD	Kim (2009)
	The use of ambient lights signals can improve the takeover performance	Kelsch (2015)
	Develop a flexible and adaptive strategy for information visualization of TOR	Flemisch (2011)
	Develop accurate graphical features (e.g. recognizable icon and solid colour coding) can improve the takeover performance	Larsson (2015)
	Haptic feedback (e.g. vibrotactile seat) can help the driver to come back into the loop)	Bazilinsky (2017)
	Use of other multimodal approach (e.g. visual and audio) can improve the takeover performance	

# Time for Take Over

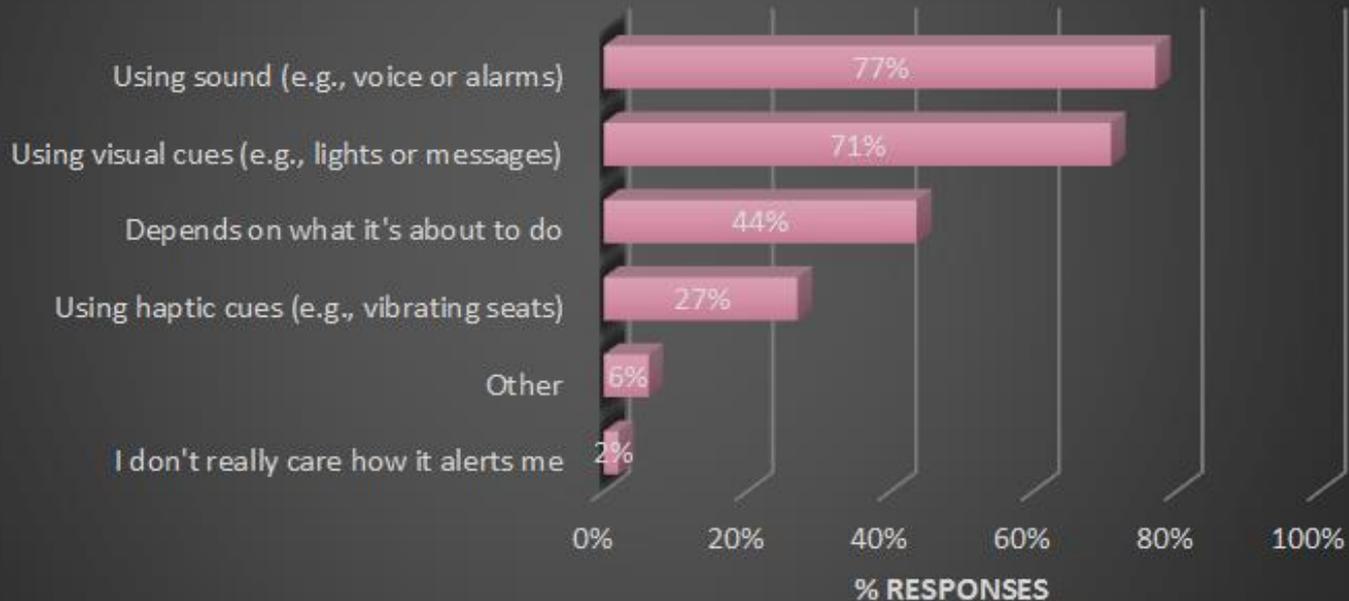

- Several experiments show that when there is a shorter take over request time, the users decide very more quickly, reacting faster, but normally with a worse quality
- Furthermore, when there is a decrease of the take over request time *"the gazes in mirrors and shoulder checks decrease, the accelerations increase, and the brake is used excessively"* (Gold C. et al, 2013).
- Studies prove that when the driver is distracted, the effects of automation are still evident with 7s take over request time (Gold C. et al, 2013).

# How do you want to interface with your autonomous car? (1/3)

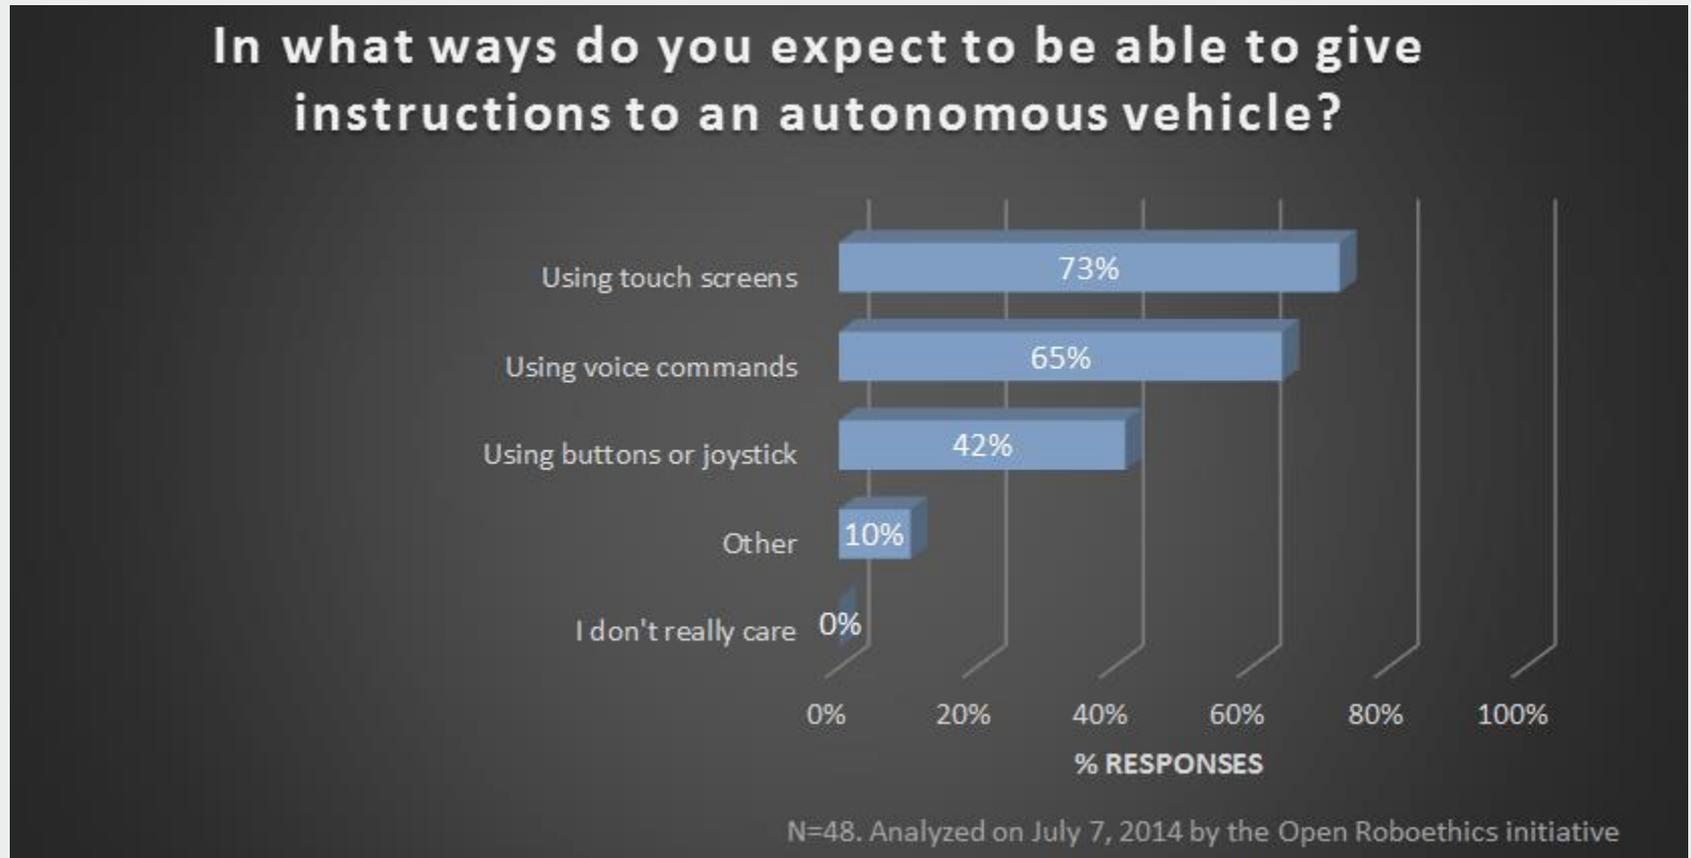

**An autonomous car will have to deviate from its planned path from time to time. How do you want an autonomous car to alert you?**

N=48. Analyzed on July 7, 2014 by the Open Roboethics initiative

# Why layer – Gowda et al. 2014

Nikhil Gowda et al. (2014): major feature of such HMI: (i) who was in control (the car or the driver), (ii) information on driver status, (iii) core of the dashboard is the navigation system.

# Design challenges

# Design challenges

- #1 - Design trustworthy automation
- #2 – Transition design

# Prototyping HMI

# POP (<https://marvelapp.com/pop/>): through away prototyping

The screenshot shows the landing page for POP by Marvel. At the top left is the Marvel logo and a 'Book a demo' button. The navigation menu includes 'Features', 'Stories', 'Explore', 'Pricing', 'Enterprise', 'Blog', 'Sign In', and 'Sign Up'. The main heading is 'POP by Marvel' with the tagline 'Prototyping on paper'. Below this, a sub-headline reads 'POP helps you transform your pen and paper ideas into an interactive iPhone or Android prototype.' A form field contains a phone number '(201) 555-5555' with a dropdown menu set to the United States, and a green 'Send download link' button. At the bottom, there are buttons for 'Download on the App Store' and 'GET IT ON Google Play'.

# Design thinking

## Objective

design the automation transition

- take over request
  - hand over
- understanding of automation status  
in a trustworthy way

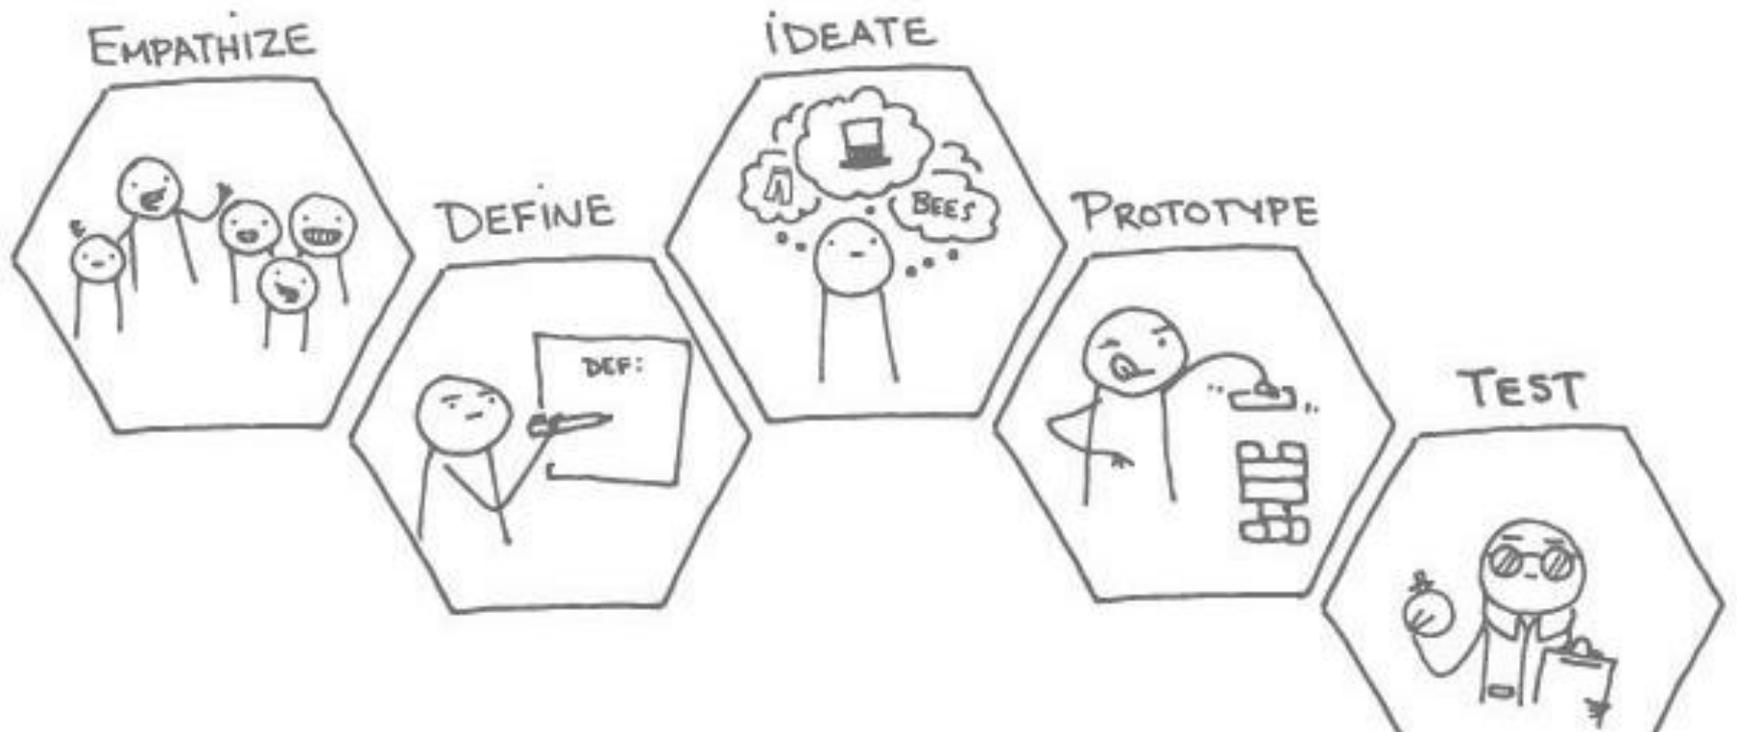

# Appendix

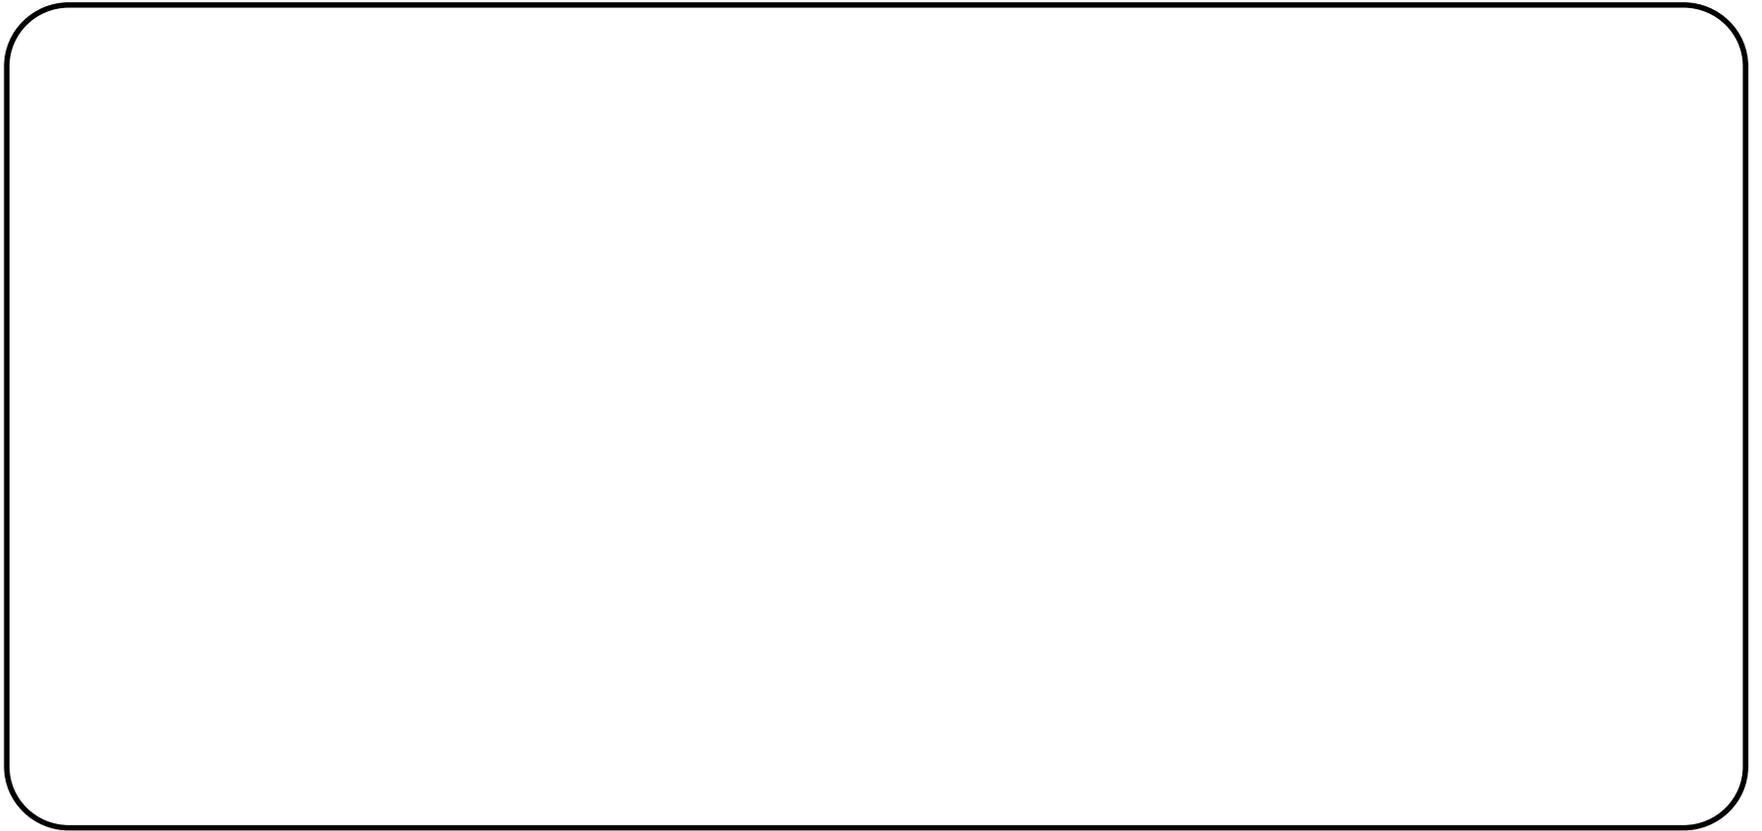

# DESIGN THINKING!

# The mission: to create an user centered solution

1 Interview 5 min

# Focus up

## 3 Catch 3 min

**Goal:** which is the most important objective for the user?

**Insights:** what have you discover about the motivations of your user?

## 2 Define 2 min

---

(user name)

**S/he needs a way to...:**

---

---

(user need)

**Why/but:**

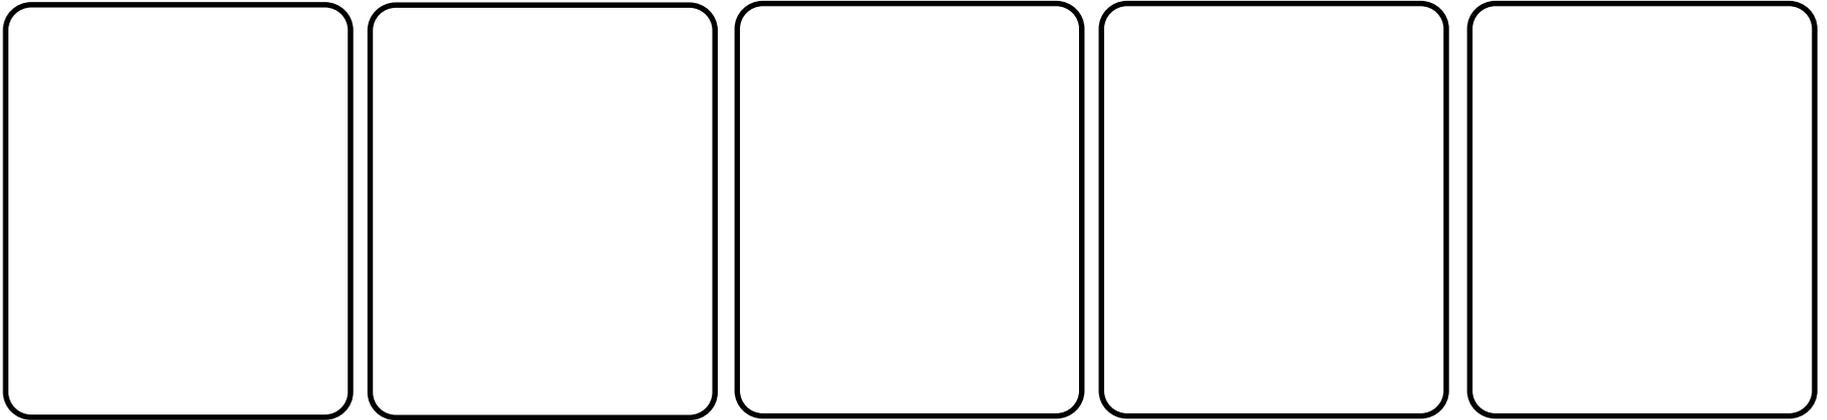

---

---

(intuition)

# Create alternative solutions

5 Sketch at least 5 ideas that match the user needs 8 min

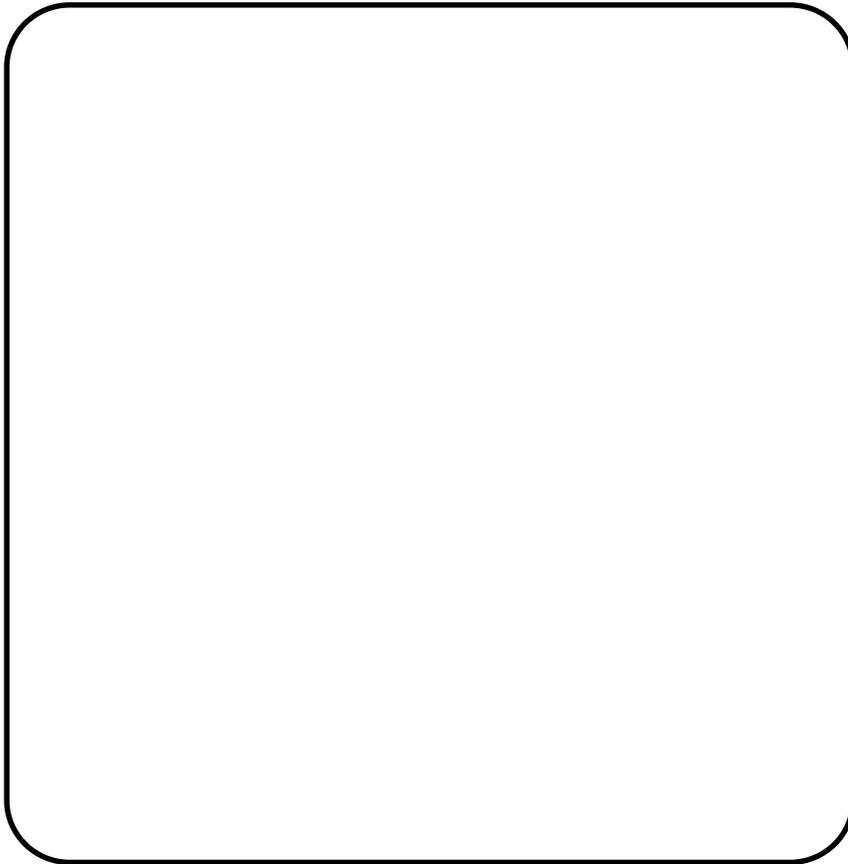

Five empty rounded rectangular boxes arranged horizontally, intended for sketching ideas.

6 Share the solutions and keep the user feedbacks 7 min

A large empty rounded rectangular box, intended for sharing solutions and keeping user feedbacks.

# Prototype and Test

**7 Think and create a new solution 6 min**

**9 Share and reach the feedbacks 4 min**

+ what is ok...
